For true *sciatica*, most people will find relief through the basic McKenzie extension exercise (named for physical therapist Robin McKenzie). This exercise is performed by lying face down on a firm surface and then propping yourself up on your elbows, creating an increase in the curve of the lower back. Getting into this position may be painful at first, but within about 30 seconds, most people will notice a decrease in the severity or the range of the *sciatica*, or both. A positive sign is when the symptoms furthest from the spine decrease. We have not actually resorted to roundabout means of getting our message on *sciatica* swimming through to you. There are several types of physical therapy that you may have to go through in order to overcome the pain. The simplest of the McKenzie exercises for alleviating *sciatica* is done by simply lying on one's stomach on the floor or a firm surface and propping one's chest up on the elbows. This places the lower spine in a gentle extension, which can help relieve *sciatica* by pushing bulging spinal discs forward, and away from the nerve roots that form the sciatic nerve, reducing pressure and irritation. Although you can maintain this position for relatively long periods of time, I recommend doing it for short periods of one or two minutes with a rest break of at least a few minutes in between. The frequent breaks prevent the low back muscles from tightening up as much, and yet still allows for good overall results. For more complex *sciatica* exercises, getting detailed instructions either through an illustrated guide or an experienced health care practitioner is advised.

This is only a temporary fix for your back pain and *sciatica*, you still need to rebalance your pelvis (the most common cause of back pain), strengthen weak muscles, reduce muscle tension and correct all the joints not working correctly.
